

PRIMARY HYPERPARATHYROID DISEASE (PHPT)

(Animal Health Diagnostic Centre - College of Veterinary Medicine, Cornell University USA)

Evidence column: Parentage = Parents/Grand Parents (or earlier) tested negative for the PHPT gene (see entries in Hereditarily Negative, or Tested Negative, PHPT Register)

Below is a list of Keeshond dogs, sorted by their country of residence, with their national Kennel Club registration numbers who are Hereditarily Negative (Negative by Descent) for the dominantly inherited Hyperparathyroid disease. These dogs are negative by virtue of the negative state of their sire and dam. There is no carrier state for a dominantly inherited gene and it only takes one positive parent to pass the gene onto approximately 50% of their progeny. The progeny of two gene negative parents, irrespective of whether they are Hereditarily Negative (Negative by Descent) or Tested Negative, will be Hereditarily Negative (Negative by Descent). Where any of the dogs listed have been imported and their country of origin has been confirmed this is shown in parenthesis, in preference to the standard (Imp) identifier.

Further information can be found on The Keeshond Club web site www.keeshondclub.org.uk

PRIMARY HYPERPARATHYROID DISEASE (PHPT)

(Animal Health Diagnostic Centre - College of Veterinary Medicine, Cornell University USA)

Evidence column: Parentage = Parents/Grand Parents (or earlier) tested negative for the PHPT gene (see entries in Hereditarily Negative, or Tested Negative, PHPT Register)

Below is a list of Keeshond dogs, sorted by their country of residence, with their national Kennel Club registration numbers who are Hereditarily Negative (Negative by Descent) for the dominantly inherited Hyperparathyroid disease. These dogs are negative by virtue of the negative state of their sire and dam. There is no carrier state for a dominantly inherited gene and it only takes one positive parent to pass the gene onto approximately 50% of their progeny. The progeny of two gene negative parents, irrespective of whether they are Hereditarily Negative (Negative by Descent) or Tested Negative, will be Hereditarily Negative (Negative by Descent). Where any of the dogs listed have been imported and their country of origin has been confirmed this is shown in parenthesis, in preference to the standard (Imp) identifier.

Further information can be found on The Keeshond Club web site www.keeshondclub.org.uk

PRIMARY HYPERPARATHYROID DISEASE (PHPT)

(Animal Health Diagnostic Centre - College of Veterinary Medicine, Cornell University USA)

Evidence column: Parentage = Parents/Grand Parents (or earlier) tested negative for the PHPT gene (see entries in Hereditarily Negative, or Tested Negative, PHPT Register)

Below is a list of Keeshond dogs, sorted by their country of residence, with their national Kennel Club registration numbers who are Hereditarily Negative (Negative by Descent) for the dominantly inherited Hyperparathyroid disease. These dogs are negative by virtue of the negative state of their sire and dam. There is no carrier state for a dominantly inherited gene and it only takes one positive parent to pass the gene onto approximately 50% of their progeny. The progeny of two gene negative parents, irrespective of whether they are Hereditarily Negative (Negative by Descent) or Tested Negative, will be Hereditarily Negative (Negative by Descent). Where any of the dogs listed have been imported and their country of origin has been confirmed this is shown in parenthesis, in preference to the standard (Imp) identifier.

Further information can be found on The Keeshond Club web site www.keeshondclub.org.uk

Dog Name	Reg/Stud No	DOB	Sex	Sire	Dam	Evidence
